SPECIMEN BOOKLET

Think Like a Coder

Computational thinking and AI for Classes 6–8

A sample for schools: a CT chapter, an AI chapter, a full project, a teacher script, the classroom kit and how assessment works

For CBSE's Computational Thinking and AI curriculum, 2026-27

Class 7 sample · NCERT maths chapters, CBSE AI chapters and projects · No lab needed

Projects and AI Pack Rs 599 per student (indicative) · Free pilot, January-March 2027

© 2026 Bullseye Knowledge System Limited. All rights reserved. Not for sale.
CodeSchool is a working name. Not an official CBSE or NCERT publication.

A complete CT&AI programme for Classes 6-8

From 2026-27, CBSE asks schools to teach Computational Thinking and AI in Classes 3-8. In Classes 6-8 it is **100 hours a year**; in Class 7 that is about 40 hours of computational thinking, 20 hours of AI and two projects of 20 hours each. CBSE's free handbook gives puzzles for each maths chapter and four AI chapters. CodeSchool turns it into a full course any teacher can run, with no computer lab needed.

What schools need	CBSE's free handbook	CodeSchool Projects and AI Pack
CT for each maths chapter	Puzzles	Theory, worked examples, practice in levels and coding on paper
AI chapters	Four chapters with exercises	The same four topics, with unplugged activities and 'build it' tasks
Coding	No	Formulas, binary, logic filters, checks and debugging on paper, ready for block or text coding
Projects (40 hours)	Hours set aside	Two complete 20-hour projects with plans, data sheets and rubrics
Teacher lesson plans	Answer keys	A period-by-period teacher script book
Assessment	No format given	Project rubrics, observation journal and term summary
Teacher training	CBSE workshops	School orientation, termly workshops and support

★ Why schools choose it

- ✓ Chapters 1-8 follow NCERT Class 7 maths in order, so the CT work fits the maths period.
- ✓ The four AI chapters match the AI part of CBSE's handbook and are taught with hands-on, unplugged activities.
- ✓ Two ready-made projects fill the 40 project hours, with plans, data sheets and rubrics.
- ✓ Works in any classroom: paper, cards and posters. A projector or computer lab helps but is optional.

© 2026 Bullseye Knowledge System Limited

What each school receives

For	What they get	Classes
Each student	Projects and AI Pack: workbook with CT chapters, AI chapters, two project units and cut-out cards	6, 7, 8
Each class section	Classroom kit: punched-card logic deck, binary cards, AI picture cards, data sheet pads, project posters, box	6, 7, 8
Each teacher	Teacher script book, answer keys, project rubrics, observation journal, short how-to videos	6, 7, 8
The school	Orientation at school, a workshop every term, a support line and a term summary format	All

The series

Book	Levels	Coder skills
Classes 3-5 Practice Packs	B1-B7	Steps, loops, if-else, variables, search and a game designed on paper (separate samples)
Class 6 Projects and AI Pack	C1-C3	Functions, lists, sieve and sorting, debugging, four AI chapters and two projects (separate sample)
Class 7 Projects and AI Pack (this sample)	C4-C5	Binary, expressions, formulas, logic filters, triangle checks, four AI chapters and two projects
Class 8 Projects and AI Pack	C6-C8	In development, following CBSE's Class 8 handbook

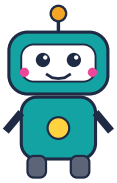

Price and ordering

Indicative price: Rs 599 per student per year (MRP) for the Classes 6-8 Projects and AI Pack, through the school's book list. It can replace an existing computer book, so the cost to parents stays about the same. Kits, teacher books and training come with the packs. Prices are indicative until confirmed in writing.

Try it first

A **free pilot** in two or three sections from January to March 2027: materials, a teacher orientation, weekly support and a short report against success measures agreed in advance. No obligation to continue.

© 2026 Bullseye Knowledge System Limited

Welcome back! I am Robo. In Class 7 we count in binary like a computer, write formulas with variables, solve logic puzzles by filtering cases, find out how AI predicts and why it can be unfair, and run two real projects.

How this book works

Learn	Robo explains one big idea in simple words, with the new coder words to remember.
Example	A worked example shows the idea step by step.
Try it!	Five practice questions. Circle the answer or write it in the box.
Now you build it	Coding on paper: put code cards in order, fix bugs and write your own programs.
Challenge	A harder puzzle for when you are ready for more.
How did I do?	Colour a face to show how sure you feel.
Projects	Two 20-hour team projects: plan, collect real data, build, test, present and score your work with a rubric.

My code cards

Coders use cards like these. Each colour means something different. You will find cut-out cards at the back of the book.

Step: do this **Repeat: a loop** **If: a decision** **Define: a function**

When: an event

For teachers and parents

Chapters 1-8 go with the same chapters of the NCERT Class 7 maths textbook, so they can be used in maths periods. AI chapters 1-4 follow the AI part of CBSE's Class 7 handbook, and the two projects run across the year. CBSE sets 100 hours a year in Class 7: about 40 for computational thinking, 20 for AI and 40 for two projects. The coding here needs no computer: students write, trace and debug programs on paper, which prepares them for block and text coding. Answers are at the back. Encourage children to explain their thinking, not just the answer.

© 2026 Bullseye Knowledge System Limited

How a lesson runs

Every lesson fits one 40-minute period and follows the same five steps, based on the PRIMM approach used in computing classrooms (predict, run, investigate, modify, make). Children learn the routine once and then focus on the thinking.

1. **Predict and run** 8 min
   Children predict what a set of steps will do, then act it out.

2. **Investigate** 8 min
   Pairs answer 'why' questions about how it worked.

3. **Modify** 8 min
   Children change the steps to do something new.

4. **Put in order** 8 min
   Jumbled code cards go back in the right order.

5. **Make** 8 min
   Pairs write their own program and swap with another pair.

How it supports CBSE's assessment

CBSE asks schools to assess CT&AI through written puzzles, group activities and a **Teacher Observation Journal**. Each step gives the teacher something to observe: predictions show reasoning, modifications show understanding, and the 'make' step shows whether a child can build an algorithm of their own. The journal format and a term summary for the report card come with the teacher book.

Every child can take part

- ✓ Children who finish early move to the challenge level; children who need help use a hint card.
- ✓ Most activities are done in pairs, so children who find reading hard can still take part by talking and acting out.
- ✓ Teacher preparation is about 5-10 minutes per lesson using the script.

© 2026 Bullseye Knowledge System Limited

Inside the full Class 7 book

The complete book has 8 CT chapters that follow the NCERT Class 7 maths textbook, 4 AI chapters that follow CBSE's handbook and two 20-hour projects, plus answers, a glossary and cut-out code cards. This sample includes CT chapter 3, AI chapter 4 and Project 2 in full.

Ch	Chapter	Coder skill	Level	In this sample
1	Large Numbers Around Us	Compare, round and estimate big numbers step by step	C4	
2	Arithmetic Expressions	Order of operations and expression trees	C4	
3	A Peek Beyond the Point	Decimals, binary numbers and punched-card sorting	C4	Yes
4	Expressions using Letter-Numbers	Variables and formulas for growing patterns	C4	
5	Parallel and Intersecting Lines	Angle rules and tracing drawing programs	C5	
6	Number Play	True or false: list every case and filter with clues	C5	
7	A Tale of Three Intersecting Lines	Triangle rules as checks; debugging a function	C5	
8	Working with Fractions	Fraction operations and working backwards	C4	
AI1	AI Domains and Applications	Classify, predict a number, or find groups	C5	
AI2	AI in Industries	AI in health, education, transport and communication	C5	
AI3	Data Visualisation and Analysis	Choose bar, line or pie charts and read them honestly	C5	
AI4	Ethics and AI Bias Awareness	Spot bias in data and keep humans in charge	C5	Yes
P1	Nutri-Quest Food Planner	Use data and rules to plan a balanced week	C5	
P2	Sort It with AI	Build a waste classifier and measure its accuracy	C5	Yes

© 2026 Bullseye Knowledge System Limited

3

CHAPTER 3 · LEVEL C4

A Peek Beyond the Point

Coder skill: Decimals, binary numbers and punched-card sorting

Goes with NCERT maths, Class 7, chapter 3

Learn

In our **decimal** system each place is worth 10 times the place to its right: ..., 100, 10, 1, and after the point 1/10, 1/100, ... So 3.47 means 3 ones, 4 tenths and 7 hundredths.

Computers use the **binary** system, where place values are 1, 2, 4, 8, 16, ... Each **bit** is 0 or 1. 23 = 16 + 4 + 2 + 1, so 23 is **10111** in binary. Five bits give 32 patterns, enough to give each of the 26 letters its own punched card.

decimal place values in tens	**binary** place values in twos	**bit** a binary digit, 0 or 1	**place value** what a digit's position is worth

Our numbers use bundles of ten. Computers use bundles of two: 1, 2, 4, 8, 16. That is binary, written with only 0 and 1!

Example

Writing 23 in binary with dot cards

1. Start from the biggest card that fits: 16. That leaves 7.
2. 8 is too big, so the 8 card is face down: 0. Then 4 (leaves 3), 2 (leaves 1) and 1.
3. Face-up cards are 1s and face-down cards are 0s: 23 = **10111**.

★ *Coder fact!* Acharya Pingala used patterns of short and long syllables, much like binary, to study poetry metres about 2,000 years ago.

© 2026 Bullseye Knowledge System Limited

Try it!

Circle the right answer, or write it in the box.

1 What is 13 in binary?

a) 1011 **b)** 1101 **c)** 1110 **d)** 1001

2 What is the binary number 10010 in decimal?

3 Every student in a class of 40 needs a different binary number. How many bits are needed?

a) 5 **b)** 6 **c)** 7 **d)** 8

4 Which is the smallest?

a) 0.5 **b)** 0.45 **c)** 0.405

5 Find the next term: 1.2, 2.4, 2.6, 5.2, 5.4, 10.8, ?

a) 11.0 **b)** 21.6 **c)** 10.10 **d)** 11.8

Now you build it

An algorithm that turns a decimal number into binary by halving.

Input n **Repeat until n is 0** **write down the remainder of n ÷ 2**

set n to n ÷ 2, dropping the remainder **read the remainders from last to first**

Trace it for 14. Write each value of n and each remainder. What binary number do you get?

Challenge

Letters are numbered A = 1 to Z = 26 and written in 5-bit binary (J = 10 = 01010). Which letter is 10011? Write the 5 bits for R.

© 2026 Bullseye Knowledge System Limited

How did I do?

I can read decimal place values.	I can change numbers between binary and decimal.	I can explain how 5 bits can label 26 letters.
		

© 2026 Bullseye Knowledge System Limited

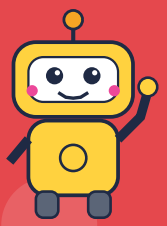

AI4

AI CHAPTER 4 · LEVEL C5

Ethics and AI Bias Awareness

AI skill: Spot bias in data and keep humans in charge

Goes with the AI part of CBSE's Class 7 CT&AI handbook, chapter 4

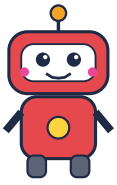

Learn

AI ethics means making sure AI is fair, open about how it decides, safe and respectful of privacy. **Bias** is an unfair preference for or against someone. Machines do not invent bias: it usually comes from the **data**.

Data bias: some groups are missing or rare in the training data. **Historical bias**: the data repeats past unfair decisions. **Measurement bias**: the wrong thing is measured. For important decisions, a **human in the loop** must check and take responsibility.

bias an unfair preference	**fairness** works equally well for everyone	**transparency** being open about how it decides	**human in the loop** a person checks the decision

I learn only from the examples people give me. If the examples are lopsided, my answers will be lopsided too!

Example

The lopsided deck

1. A classifier learns 'fruit or vegetable' from 18 fruit cards and only 2 vegetable cards.
2. It learns that almost everything is a fruit. On a test of 50 fruits and 10 vegetables it gets 45 fruits but only 3 vegetables right.
3. Overall it is 48 of 60 = 80% right, which looks good, but it is only **30%** right for vegetables. Fix: add vegetable examples and check each group.

Group	Training cards	Right in the test
Fruit	18	45 of 50 (90%)
Vegetable	2	3 of 10 (30%)

★ *Coder fact!* India's Digital Personal Data Protection Act, 2023 sets rules for how organisations may use people's personal data.

© 2026 Bullseye Knowledge System Limited

Try it!

Circle the right answer, or write it in the box.

1 A hiring system learnt from past decisions in which mostly men were hired, and now prefers men. This is ...

a) data bias
b) historical bias
c) measurement bias

2 A face recogniser trained mostly on one group of people often fails for others. This is ...

a) data bias
b) historical bias
c) measurement bias

3 A health AI judges how ill people are from how much money they spent on treatment. This is ...

a) data bias
b) historical bias
c) measurement bias

4 An AI rejects a loan application. What should happen next?

a) a person should review the decision
b) nothing: the AI is always right
c) the applicant should never apply again

5 Before sharing a shocking news post about a classmate, you should ...

a) check it with a trusted source, and not share hurtful posts
b) share it quickly
c) add your own comments

Specimen copy · not for sale

© 2026 Bullseye Knowledge System Limited

Now you build it

A fairness check you can run on any classifier.

Count each group in the training data

If one group is much smaller

add more examples of that group

Test on a balanced test set

Compare accuracy for each group

After adding 16 vegetable cards, the classifier gets 46 of 50 fruits and 9 of 10 vegetables right. Work out the accuracy for each group and overall. Is it fairer?

Challenge

Write two rules a school should follow before using AI to help choose students for a competition.

How did I do?

I can explain three kinds of bias.	I can check accuracy for each group.	I can say why humans must review important decisions.
		

© 2026 Bullseye Knowledge System Limited

P2

PROJECT 2 · 20 HOURS · LEVEL C5

Sort It with AI

Project skill: Build a waste classifier and measure its accuracy

CBSE: 40 project hours a year in Class 7, as two projects of 20 hours

The big question

Can we teach a classifier to put school waste in the right bin, and measure how often it is right?

Waste is easier to recycle when it goes in the right bin: **wet** (food and garden waste), **dry** (paper, plastic, metal, glass) or **hazardous** (batteries, bulbs, medicines). Your team makes 60 picture cards of waste items and labels each one.

Use 40 cards to find rules (training) and keep 20 for testing. Write the rules as a decision tree, test it, measure the accuracy, study the mistakes, improve, and test again. Schools with computers can also train a no-code model on photos and compare.

label the right answer for an example	**feature** something you can observe	**accuracy** correct ÷ total	**test set** examples kept back for checking

My project plan

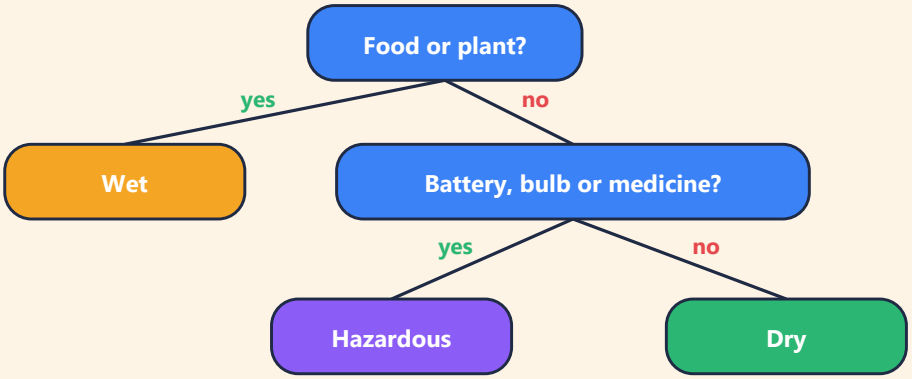

Weeks	Stage	What I do	Done
1	**Define**	Agree the question and the three bins. Decide how you will measure success.	☐
2	**Collect**	Make 60 picture cards of waste items, about 20 for each bin, and label each one.	☐
3	**Check labels**	Check unclear labels with your teacher. Shuffle and split: 40 training, 20 test.	☐
4	**Find features**	Study the training cards: what can you observe that separates the bins?	☐
5	**Build**	Write your rules as a decision tree with yes/no questions.	☐
6	**Test**	Run the tree on the 20 test cards. Record each prediction and the true label.	☐
7	**Measure**	Work out the accuracy. Make a table of which bins were mixed up.	☐
8	**Improve**	Fix a rule or add training cards, then test on new cards you have not used.	☐
9	**Present**	Show the tree, the results before and after, and what you learnt.	☐
10	**Reflect**	Score your work with the rubric. Which mistakes matter most?	☐

© 2026 Bullseye Knowledge System Limited

How a coder does it

Testing a decision tree (practice data)

1. The tree asks: *Is it food or a plant?* If yes: wet. If no: *Is it a battery, bulb or medicine?* If yes: hazardous; if no: dry.
2. On 20 test cards it got 17 right: accuracy = 17 ÷ 20 = **85%**.
3. The 3 mistakes show what to fix: a used tissue with food, a broken thermometer and a paint tin had no question that fitted them.

Test results

One row per test card. Write the true label, your tree's prediction, and whether it was right.

Card	Item	True bin	Predicted bin	Right? (Y/N)

© 2026 Bullseye Knowledge System Limited

A classifier is only as good as its examples. Test it on cards it has never seen, count the mistakes, and improve!

★ How good is my project?

Score each row from 1 (just starting) to 4 (excellent). Then your teacher scores it too. Talk about any row where the scores differ.

What we check	What excellent (4) looks like	Me	Teacher
Data	60 clearly labelled cards; labels checked; test cards kept apart.	1 2 3 4	1 2 3 4
Rules	A clear decision tree that uses features anyone can observe.	1 2 3 4	1 2 3 4
Testing	Accuracy worked out correctly on unseen cards; mistakes listed.	1 2 3 4	1 2 3 4
Improvement	A rule or the data is improved, and accuracy is measured again.	1 2 3 4	1 2 3 4
Fairness and honesty	Real results reported, and accuracy checked for each bin.	1 2 3 4	1 2 3 4
Talk and teamwork	A clear presentation; the work is shared fairly.	1 2 3 4	1 2 3 4

✓ Fair, safe and honest?

- [ ] We kept the test cards apart until the end.
- [ ] We reported our real accuracy, even when it was low.
- [ ] We checked unclear labels with our teacher instead of guessing.
- [ ] We asked which mistakes could cause harm, like a battery in the wet bin.

Looking back

Which items were hardest to classify, and why?

How could a wrong prediction cause harm in real life?

© 2026 Bullseye Knowledge System Limited

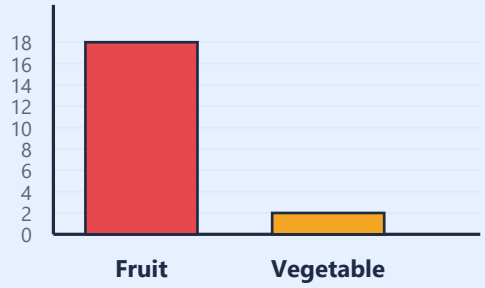

Sample teacher script: The lopsided deck

From the teacher book, Class 7, AI chapter 4 (*Ethics and AI Bias Awareness*). One 40-minute period. Level C5.

You need	
Kit	AI picture cards: a lopsided training deck (18 fruit, 2 vegetable cards), a test deck (10 fruit, 10 vegetable), 8 extra vegetable cards, scoring slips
Book	AI chapter 4 pages, 'Try it' questions 1-3
Goal	Students see how unbalanced training data makes a classifier unfair, measure accuracy for each group, and fix the data

Step and time	Teacher does	Children do
1. Predict and run (8 min)	Groups look only at the lopsided training deck and write a rule for 'fruit or vegetable'.	Predict how many test cards their rule will get right.
2. Investigate (8 min)	Hand out the test deck. Ask: 'Which group does your rule get wrong most often?'	Count right answers for fruits and vegetables separately.
3. Modify (8 min)	Give out the 8 extra vegetable cards.	Rewrite the rule using the more balanced training deck, then test again.
4. Put in order (8 min)	Give out jumbled step cards: count groups, find the gap, add examples, test, compare.	Order the steps of a fairness check.
5. Make (8 min)	Ask: 'Where could this happen in real life?'	Write one real example (faces, voices, languages) and how to check it.

Lesson set-up

Set-up: keep the decks apart. The training deck has 18 fruit cards but only 2 vegetable cards; the test deck has 10 of each.

Common mistakes to watch for

- **Trusting the overall score.** A good overall score can hide a group that is mostly wrong. Always check each group.
- **Blaming the machine.** A classifier copies its examples; the bias came from the data people chose.
- **Fixing by removing.** Taking the hard cards out of the test deck hides the problem instead of solving it.

© 2026 Bullseye Knowledge System Limited

Different paces

Support: give groups a ready-made rule and ask them only to test it and count.
Stretch: write accuracy for each group as a percentage, before and after adding vegetable cards, and draw a bar chart of both.

Check for understanding

Two quick questions at the end of the period:

1. A classifier gets 45 of 50 fruits and 3 of 10 vegetables right. What is its overall accuracy? (48 of 60 = 80%) 2. Why is 80% misleading here? (vegetables are only 30% right)

Note in the observation journal: **Beginning** (says the rule is wrong), **Developing** (counts errors with help), **Secure** (measures accuracy for each group), **Extending** (links the errors to missing data and proposes a fix).

Curriculum link

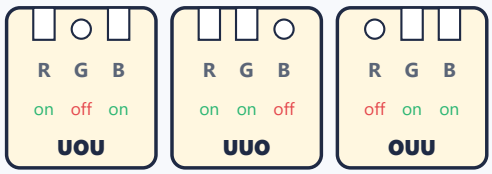

CBSE's Class 7 handbook explains data, historical and measurement bias and why humans must stay in the loop. In this lesson students create bias, measure it and fix it with their own hands.

Teacher notes

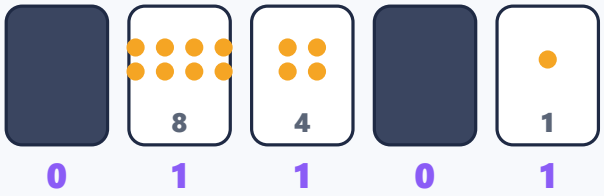

© 2026 Bullseye Knowledge System Limited

The classroom kit

One kit per class section, used all year. Everything is printed, laminated and reusable.

Punched-card logic deck with sorting sticks (32 cards)

Binary dot cards 16, 8, 4, 2, 1 (20 sets)

AI picture cards: waste, fruit and vegetable sets (120)

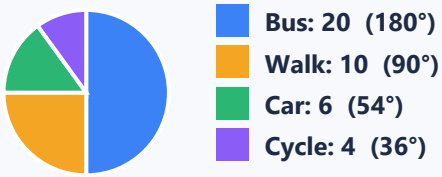

Chart and data boards, write-on, wipe-off (10)

Item	Quantity per kit
Punched-card logic deck with sticks	32 cards, 6 sticks
Binary dot cards	20 sets of 5
AI picture cards (waste, fruit, vegetable)	120
Function, loop and decision card decks	4 decks of 54
Project data sheet pads (A4)	2 pads of 50
Project posters: plan, rubric, fair AI	3
Teacher quick-guide card	1
Sturdy box	1

Illustrations show the design. Final materials will be confirmed after the pilot.

© 2026 Bullseye Knowledge System Limited

Assessment and the report card

CBSE asks for continuous, competency-based assessment in CT&AI. The teacher book includes an observation journal using four levels, and a term summary that fits on the report card.

Skill	Beginning	Developing	Secure	Extending
Algorithms and formulas	Follows given steps	Evaluates expressions in the right order	Writes formulas and traces programs	Designs and debugs checks
Logic	Uses one clue	Filters cases with two clues	Lists every case and filters them	Explains why a rule always holds
AI ideas	Names AI domains	Tells classification, regression, clustering apart	Measures accuracy on test data	Finds and explains bias in data
Projects	Takes part with help	Completes stages with help	Plans, tests and presents with the team	Improves the work using evidence

Sample term summary

Area	Level	Teacher comment
Computational thinking (overall)	Secure	Converts to binary confidently and writes formulas for growing patterns.
AI and ethics	Developing	Spots data bias; next step: checking accuracy for each group.
Project 2: Sort It with AI	Rubric 20 of 24	Careful testing on unseen cards; the decision tree needs a rule for unclear items.

Children check themselves too

Each chapter ends with **'How did I do?'**, where children colour a face for each 'I can' statement. Teachers can compare this with what they observed, which helps children learn to judge their own progress.

© 2026 Bullseye Knowledge System Limited

Answers for the sample chapters

3. A Peek Beyond the Point

1. b) 1101 (8 + 4 + 1)
2. 18 (16 + 2)
3. b) 6: 5 bits give only 32 numbers, 6 bits give 64
4. c) 0.405
5. a) 11.0 (alternately x 2 and + 0.2)
Build it: 14: remainder 0, n = 7; remainder 1, n = 3; remainder 1, n = 1; remainder 1, n = 0. Read backwards: 1110
Challenge: 10011 = 19 = S; R = 18 = 10010

AI 4. Ethics and AI Bias Awareness

1. b) historical bias
2. a) data bias
3. c) measurement bias: spending is not the same as illness
4. a) a person should review it, because important decisions need a human in the loop
5. a) check it, and never share posts that hurt someone
Build it: Fruit 92%, vegetable 90%, overall 55 of 60 (about 92%). Yes: both groups are now about equally accurate
Challenge: Open answer, for example: a teacher makes the final decision; check that the AI works equally well for every group; explain to students how it was used

A note for parents

Schools can send this page home at the start of the year.

Dear parents,

This year your child will learn **computational thinking and AI**, following CBSE's new curriculum for Classes 3-8. In Class 7 that is about 100 hours over the year: problem solving linked to maths, four AI chapters and two group projects.

Your child will use the *Think Like a Coder* workbook. Most of the work is on paper: writing exact steps, using binary and formulas, solving logic puzzles, learning how AI predicts and why it can be unfair, and using technology responsibly.

How you can help at home

- ✓ Ask your child to show you how to write your age in binary.
- ✓ Talk about AI you see, such as route apps, video suggestions and translation. What data might they use? Could they be unfair to anyone?
- ✓ Before sharing news online, check it together with a trusted source.
- ✓ Praise careful thinking and honest results, even when a project does not go to plan.

Take-home challenge

Write your age and your house number in binary. Which one has more 1s?

Answer: answers vary; check by adding the place values (16, 8, 4, 2, 1).

No child's personal data is collected by the workbook. Thank you for your support.

Class teacher _____ **School** _____

© 2026 Bullseye Knowledge System Limited

Next steps for your school

1. **Look through this sample**
   Try a chapter with a class or ask a teacher to review it.

2. **Talk to us**
   A short meeting with the principal and coordinator to answer questions.

3. **Start a free pilot**
   Two or three sections, January to March 2027, with an orientation and weekly support.

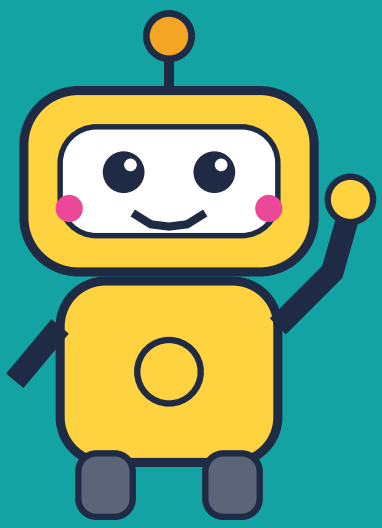

4. **Add it to the 2027-28 book list**
   Most schools finalise their list by the end of January.
