SPECIMEN BOOKLET

Think Like a Coder

Computational thinking and AI for Classes 6–8

A sample for schools: a CT chapter, an AI chapter, a full project, a teacher script, the classroom kit and how assessment works

For CBSE's Computational Thinking and AI curriculum, 2026-27

Class 8 sample · NCERT maths chapters, CBSE AI chapters and projects · Lab optional Projects and AI Pack Rs 599 per student (indicative) · Free pilot, January-March 2027

© 2026 Bullseye Knowledge System Limited. All rights reserved. Not for sale.
CodeSchool is a working name. Not an official CBSE or NCERT publication.

A complete CT&AI programme for Classes 6-8

From 2026-27, CBSE asks schools to teach Computational Thinking and AI in Classes 3-8. In Classes 6-8 it is **100 hours a year**; in Class 8 that is about 40 hours of computational thinking, 20 hours of AI and two projects of 20 hours each. CBSE's free handbook gives puzzles for each maths chapter and four AI chapters. CodeSchool turns it into a full course any teacher can run, with or without a computer lab.

What schools need	CBSE's free handbook	CodeSchool Projects and AI Pack
CT for each maths chapter	Puzzles	Theory, worked examples, practice in levels and coding on paper
AI chapters	Four chapters with exercises and no-code labs	The same four topics, with step-by-step activities, card versions of the labs and 'build it' tasks
Coding	No	Base converters, classifiers, test functions and data cleaning on paper, ready for block or text coding
Projects (40 hours)	Hours set aside	Two complete 20-hour projects with plans, data sheets and rubrics
Teacher lesson plans	Answer keys	A period-by-period teacher script book
Assessment	No format given	Project rubrics, observation journal and term summary
Teacher training	CBSE workshops	School orientation, termly workshops and support

★ Why schools choose it

- ✓ Chapters 1-7 follow NCERT Class 8 maths in order, so the CT work fits the maths period.
- ✓ The four AI chapters match the AI part of CBSE's handbook, with card versions of the no-code labs for schools without devices.
- ✓ Two ready-made projects fill the 40 project hours, with plans, data sheets and rubrics.
- ✓ Works in any classroom: paper, cards and posters. A projector or computer lab helps but is optional.

© 2026 Bullseye Knowledge System Limited

What each school receives

For	What they get	Classes
Each student	Projects and AI Pack: workbook with CT chapters, AI chapters, two project units and cut-out cards	6, 7, 8
Each class section	Classroom kit: number-base strips, dataset cards, AI audit picture cards, shape cards, data pads, posters, box	6, 7, 8
Each teacher	Teacher script book, answer keys, project rubrics, observation journal, short how-to videos	6, 7, 8
The school	Orientation at school, a workshop every term, a support line and a term summary format	All

The series

Book	Levels	Coder skills
Classes 3-5 Practice Packs	B1-B7	Steps, loops, if-else, variables, search and a game designed on paper (separate samples)
Class 6 Projects and AI Pack	C1-C3	Functions, lists, sieve and sorting, debugging, four AI chapters and two projects (separate sample)
Class 7 Projects and AI Pack	C4-C5	Binary, formulas, logic filters, triangle checks, four AI chapters and two projects (separate sample)
Class 8 Projects and AI Pack (this sample)	C6-C8	Number bases, classifiers, identities, proportion, the AI project lifecycle, fairness and two projects

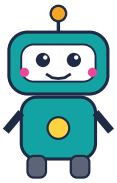

Price and ordering

Indicative price: Rs 599 per student per year (MRP) for the Classes 6-8 Projects and AI Pack, through the school's book list. It can replace an existing computer book, so the cost to parents stays about the same. Kits, teacher books and training come with the packs. Prices are indicative until confirmed in writing.

Try it first

A **free pilot** in two or three sections from January to March 2027: materials, a teacher orientation, weekly support and a short report against success measures agreed in advance. No obligation to continue.

© 2026 Bullseye Knowledge System Limited

Welcome to Class 8! I am Robo. This year we write numbers in any base, sort shapes with if-else rules, calculate like a computer, run a full AI project from problem to model, make AI fairer, and lead two real projects.

How this book works

Learn	Robo explains one big idea in simple words, with the new coder words to remember.
Example	A worked example shows the idea step by step.
Try it!	Five practice questions. Circle the answer or write it in the box.
Now you build it	Coding on paper: put code cards in order, fix bugs and write your own programs.
Challenge	A harder puzzle for when you are ready for more.
How did I do?	Colour a face to show how sure you feel.
Projects	Two 20-hour team projects: plan, collect real data, build, test, present and score your work with a rubric.

My code cards

Coders use cards like these. Each colour means something different. You will find cut-out cards at the back of the book.

Step: do this **Repeat: a loop** **If: a decision** **Define: a function**

When: an event

For teachers and parents

Chapters 1-7 go with the same chapters of the NCERT Class 8 maths textbook, so they can be used in maths periods. AI chapters 1-4 follow the AI part of CBSE's Class 8 handbook, and the two projects run across the year. CBSE sets 100 hours a year in Class 8: about 40 for computational thinking, 20 for AI and 40 for two projects. The coding here needs no computer: students write, trace and debug programs on paper, which prepares them for block and text coding. Answers are at the back. Encourage children to explain their thinking, not just the answer.

© 2026 Bullseye Knowledge System Limited

How a lesson runs

Every lesson fits one 40-minute period and follows the same five steps, based on the PRIMM approach used in computing classrooms (predict, run, investigate, modify, make). Children learn the routine once and then focus on the thinking.

1. **Predict and run** 8 min
   Children predict what a set of steps will do, then act it out.

2. **Investigate** 8 min
   Pairs answer 'why' questions about how it worked.

3. **Modify** 8 min
   Children change the steps to do something new.

4. **Put in order** 8 min
   Jumbled code cards go back in the right order.

5. **Make** 8 min
   Pairs write their own program and swap with another pair.

How it supports CBSE's assessment

CBSE asks schools to assess CT&AI through written puzzles, group activities and a **Teacher Observation Journal**. Each step gives the teacher something to observe: predictions show reasoning, modifications show understanding, and the 'make' step shows whether a child can build an algorithm of their own. The journal format and a term summary for the report card come with the teacher book.

Every child can take part

- ✓ Children who finish early move to the challenge level; children who need help use a hint card.
- ✓ Most activities are done in pairs, so children who find reading hard can still take part by talking and acting out.
- ✓ Teacher preparation is about 5-10 minutes per lesson using the script.

© 2026 Bullseye Knowledge System Limited

Inside the full Class 8 book

The complete book has 7 CT chapters that follow the NCERT Class 8 maths textbook, 4 AI chapters that follow CBSE's handbook and two 20-hour projects, plus answers, a glossary and cut-out code cards. This sample includes CT chapter 3, AI chapter 1 and Project 2 in full.

Ch	Chapter	Coder skill	Level	In this sample
1	A Square and a Cube	Test squares and cubes with prime factors and loops	C6	
2	Power Play	Exponents, doubling and counting combinations	C6	
3	A Story of Numbers	Number bases: binary, ternary and changing base	C6	Yes
4	Quadrilaterals	Classify shapes with if-else rules	C6	
5	Number Play	Divisibility rules and remainders as quick tests	C7	
6	We Distribute Yet Things Multiply	The distributive property and identities for fast calculation	C7	
7	Proportional Reasoning	Ratios, the unitary method and scaling	C7	
AI1	AI Project Lifecycle	Define, collect, train, test and deploy	C8	Yes
AI2	AI and Its Applications	AI for people and planet; training no-code models	C8	
AI3	Data and Fairness in AI	Spot unbalanced data and rebalance it	C8	
AI4	Ethics and Responsible AI	Privacy, checking facts and human accountability	C8	
P1	Sports for Everyone	Survey, analyse with ratios and recommend changes	C8	
P2	Fair AI Audit	Test a classifier for bias, rebalance and report	C8	Yes

© 2026 Bullseye Knowledge System Limited

3

CHAPTER 3 · LEVEL C6

A Story of Numbers

Coder skill: Number bases: binary, ternary and changing base

Goes with NCERT maths, Class 8, chapter 3

Learn

In a **place-value** system each place is worth the **base** times the place to its right. Base 10 uses digits 0-9 and places 1, 10, 100, ... Base 2 (binary) uses 0 and 1 and places 1, 2, 4, 8, ... Base 3 (ternary) uses 0, 1 and 2 and places 1, 3, 9, 27, ...

Any number can be written in any base. To convert, divide by the base again and again and read the remainders backwards. Older systems like Roman numerals have no place value and no zero, which makes calculating much harder.

number base how many digits a system uses	**place value** what a position is worth	**ternary** base 3	**numeral** a symbol for a number

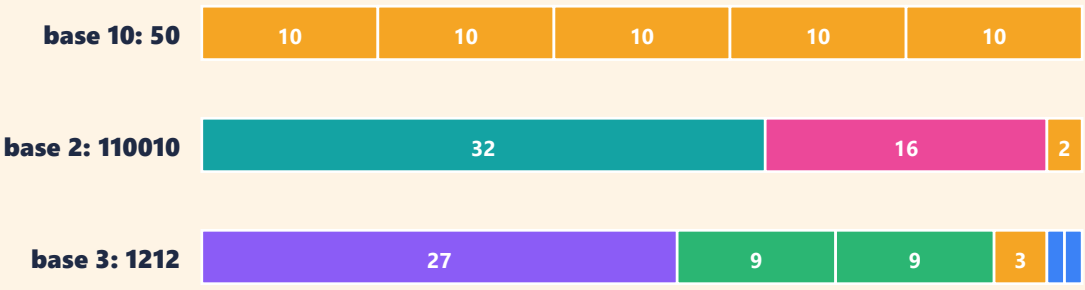

Measure 50 inches with pipes! Decimal pipes are 1, 10, 100 long. Binary pipes are 1, 2, 4, 8, 16, 32. Ternary pipes are 1, 3, 9, 27.

Example

50 inches with three kinds of pipe

1. Decimal: 50 = 5 tens, so **50**.
2. Binary: 50 = 32 + 16 + 2, so **110010**.
3. Ternary: 50 = 1 x 27 + 2 x 9 + 1 x 3 + 2 x 1, so **1212**. The same length, three different names.

© 2026 Bullseye Knowledge System Limited

Try it!

Circle the right answer, or write it in the box.

1 What is 10 in binary?

a) 1010 **b)** 1111 **c)** 1000 **d)** 1100

2 What is the largest digit allowed in base 5?

a) 5 **b)** 4 **c)** 9 **d)** 1

3 (1021) in base 3 is which decimal number?

4 How is 1947 written in Roman numerals?

a) MCMXLVII **b)** MCMXXXXVII **c)** MDCCCCXLVII **d)** MCMLXVII

5 With binary pipes (one each of 1, 2, 4, 8, 16, 32), how many pipes measure 63 inches?

a) 2 **b)** 5 **c)** 6 **d)** 7

Now you build it

One algorithm that converts to any base.

Input n and base b | **Repeat until n is 0** | **write down the remainder of n ÷ b** | **set n to n ÷ b, dropping the remainder** | **read the remainders from last to first**

Trace it for n = 100 and b = 3. Write each n and each remainder.

Challenge

Why do computers use binary rather than base 10? Then: what is the largest number you can write with 4 ternary digits?

© 2026 Bullseye Knowledge System Limited

✓ How did I do?

I can write numbers in base 2, 3 and 10.	I can convert using repeated division.	I can compare place value with Roman numerals.
		

© 2026 Bullseye Knowledge System Limited

AI1

AI CHAPTER 1 · LEVEL C8

AI Project Lifecycle

AI skill: Define, collect, train, test and deploy

Goes with the AI part of CBSE's Class 8 CT&AI handbook, chapter 1

Learn

An **AI project** builds a smart system that learns from data. Not every problem needs AI: a car wash that runs the same steps for every car is automation. The **AI project lifecycle** has five stages: (1) **define the problem**, (2) **collect and prepare data**, (3) **train a model**, (4) **evaluate and refine** it, and (5) **deploy** it for real use.

Raw data is messy. **Cleaning** removes missing values, duplicates, wrong values and irrelevant data. A model is tested on **test data** it has never seen, and its **accuracy** is the share of predictions it gets right.

problem statement what the AI must do	**data cleaning** fixing messy data	**model** what the AI learns from data	**deployment** putting it to real use

Building an AI is a project with stages. Get the problem and the data right first, or the model will be wrong!

Example

Cleaning a small dataset before training

1. The goal: predict whether a student will score more than 75%. Each row is one past student.
2. Rows 2 to 5 each have a problem. Fill or drop the missing value, delete the duplicate, check the impossible value and drop the irrelevant column.
3. Only clean, labelled data goes into training. Bad data in means bad predictions out.

Row	Data	Problem
1	Asha, 6 h study, 92%	OK
2	Ben, (blank), 81%	missing value
3	Asha, 6 h study, 92%	duplicate of row 1
4	Chetan, 25 h a day, 78%	impossible value
5	Dev, 4 h, 85%, likes blue	'likes blue' is irrelevant

© 2026 Bullseye Knowledge System Limited

Try it!

Circle the right answer, or write it in the box.

1 What is the first stage of an AI project?

a) define the problem
b) deploy the model
c) train the model
d) collect prizes

2 A model gets 18 of 24 test cases right. What is its accuracy?

3 Which of these does NOT need AI?

a) a car wash that runs the same steps for every car
b) spotting spam emails
c) reading handwriting

4 Why is test data kept apart from training data?

a) to check the model on data it has not seen
b) to make training faster
c) it is not needed

5 A dataset has the same row twice. Which step fixes this?

a) remove duplicates
b) fill missing values
c) label the data

© 2026 Bullseye Knowledge System Limited

Now you build it

An online shop wants an AI that predicts whether a delivery will be late. Plan the project.

- **Define: predict 'late' or 'on time' for each order**
- **Collect: distance, weather, traffic and result of past orders**
- **Prepare: clean the data and label each order**
- **Train on 80% of the orders**
- **Test on the other 20%; work out accuracy**
- **If accuracy is too low, improve the data and retrain**

The model gets 34 of 40 test orders right. What is its accuracy? The shop needs 90%. Should it deploy the model?

Challenge

Plan an AI that spots fake news: write one line for each stage of the lifecycle.

How did I do?

I can name the stages of an AI project.	I can clean a small dataset.	I can measure accuracy and decide whether to deploy.
		

© 2026 Bullseye Knowledge System Limited

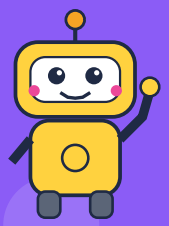

P2

PROJECT 2 · 20 HOURS · LEVEL C8

Fair AI Audit

Project skill: Test a classifier for bias, rebalance and report

CBSE: 40 project hours a year in Class 8, as two projects of 20 hours

The big question

Is a picture classifier equally good for everything it is used on, and can we make it fairer?

Your team audits a classifier: one you train with a no-code tool, like the cat-and-dog activity in CBSE's handbook, or the card version from your kit. Build a balanced test set it has never seen and measure the accuracy for each group.

Then study the training data: which groups or situations are missing or rare? Rebalance it, retrain, test again on the same test set, and write an audit report with your findings, your fix and the limits that remain.

audit a careful, independent check	**test set** examples kept back for checking	**group accuracy** accuracy for one group	**gap** difference between groups

My project plan

Weeks	Stage	What I do	Done
1	**Define**	Choose the classifier and the groups to compare (for example cats and dogs, indoor and outdoor).	☐
2	**Prepare**	Build a balanced test set: 20 unseen examples per group.	☐
3	**Test**	Run every test example and record the prediction and the true label.	☐
4	**Measure**	Work out the accuracy for each group and the gap between them.	☐
5	**Investigate**	Count the training examples per group. How are they alike, and how are they different?	☐
6	**Rebalance**	Add varied examples of the weak group: other backgrounds, lights and types.	☐
7	**Retest**	Retrain and test again on the same test set.	☐
8	**Compare**	Make a before-and-after table and a bar chart.	☐
9	**Report**	Write the audit report: findings, fix, remaining limits and advice.	☐
10	**Reflect**	Score your work with the rubric. Where could such gaps harm people?	☐

© 2026 Bullseye Knowledge System Limited

How a coder does it

An audit in numbers (practice data)

1. Training data: 120 dog photos of many breeds, mostly outdoors; only 30 cat photos, mostly indoors.
2. Before: dogs 95% right but cats only 55%, a gap of 40 points, hidden inside 75% overall.
3. After adding 90 varied cat photos: dogs 90%, cats 85%. The gap shrank to 5 points and overall accuracy rose to 87.5%.

	Before	After
Dogs right	19 of 20 (95%)	18 of 20 (90%)
Cats right	11 of 20 (55%)	17 of 20 (85%)
Overall	30 of 40 (75%)	35 of 40 (87.5%)

Audit record

One row per test image. Write notes about anything that might matter, like background or light.

Image	Group	True label	Predicted	Right? (Y/N)	Notes

© 2026 Bullseye Knowledge System Limited

An audit doesn't trust the overall score. Check every group, find the gap, fix the data, and test again!

★ How good is my project?

Score each row from 1 (just starting) to 4 (excellent). Then your teacher scores it too. Talk about any row where the scores differ.

What we check	What excellent (4) looks like	Me	Teacher
Audit question	Clear groups to compare and a fair, balanced test set.	1 2 3 4	1 2 3 4
Testing	Accuracy measured for each group on unseen data.	1 2 3 4	1 2 3 4
Investigation	Training data counted and its gaps explained.	1 2 3 4	1 2 3 4
Improvement	Data rebalanced and the model retested on the same test set.	1 2 3 4	1 2 3 4
Report	Findings, fix and remaining limits stated honestly.	1 2 3 4	1 2 3 4
Teamwork and talk	Work shared fairly; a clear presentation.	1 2 3 4	1 2 3 4

✓ Fair, safe and honest?

- [ ] We used only pictures we were allowed to use, with no photos of people.
- [ ] We tested every group with the same kind of test set.
- [ ] We reported the gap honestly, even after our fix.
- [ ] We said what our audit cannot show.

Looking back

What caused the biggest unfairness in your classifier?

Where in real life could a gap like this harm people?

© 2026 Bullseye Knowledge System Limited

Sample teacher script: An AI project on paper

From the teacher book, Class 8, AI chapter 1 (*AI Project Lifecycle*). One 40-minute period. Level C8.

You need	
Kit	Dataset cards: 24 past deliveries (distance, weather, traffic, late or on time), including 2 duplicates and 2 with missing values; scoring slips
Book	AI chapter 1 pages, 'Try it' questions 2-5
Goal	Students run every stage of the AI project lifecycle by hand: define, clean, train a rule, test it on unseen cards and decide whether to deploy

Step and time	Teacher does	Children do
1. Predict and run (8 min)	Read the problem: predict whether a delivery will be late. Hand out the 24 dataset cards.	Groups predict which features will matter most, then clean the deck: remove duplicates and cards with missing values.
2. Investigate (8 min)	Ask groups to put 5 cards aside as test cards without looking at them.	Using the other cards, find a rule, such as 'heavy traffic and over 10 km means late'.
3. Modify (8 min)	Groups test their rule on the 5 unseen cards.	Count correct predictions and work out the accuracy.
4. Put in order (8 min)	Give out jumbled stage cards: define, collect, prepare, train, test, deploy.	Order the lifecycle and match each stage to what they did.
5. Make (8 min)	Ask: 'Your rule is 60% accurate. Would you deploy it? What would you change?'	Improve the rule or suggest new data, and give a deploy decision with a reason.

Lesson set-up

Set-up: shuffle the dataset cards, including the 2 duplicates and 2 cards with missing values, so cleaning is a real step. Keep 5 cards unseen for testing.

Common mistakes to watch for

- **Testing on the training cards.** A rule always looks good on the examples it was made from; only unseen cards give a fair score.
- **Skipping cleaning.** Duplicates make one order count twice and can tip the rule the wrong way.
- **Deploying because it is 'mostly right'.** Decide what accuracy is good enough before testing, and say who is affected by the mistakes.

© 2026 Bullseye Knowledge System Limited

Different paces

Support: give groups a starting rule and ask them only to clean, test and count.
Stretch: compare two rules on the same test cards and argue which to deploy; work out accuracy for 'late' and 'on time' cards separately.

Check for understanding

Two quick questions at the end of the period:

1. Why must the test cards be kept apart from the training cards? (to check the rule on data it has not seen) 2. A rule gets 4 of 5 test cards right. What is its accuracy? (80%)

Note in the observation journal: **Beginning** (names some stages), **Developing** (cleans data with help), **Secure** (runs every stage and works out accuracy), **Extending** (justifies a deploy decision from the results).

Curriculum link

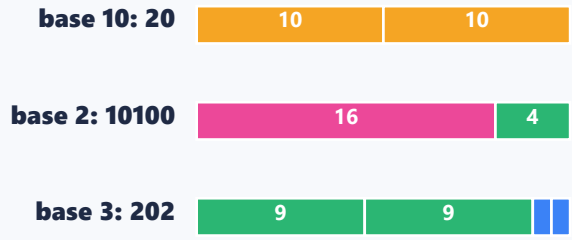

CBSE's Class 8 handbook presents the AI project lifecycle, from problem definition and data preparation to training, evaluation and deployment. In this lesson students run every stage by hand before they use a no-code tool.

Teacher notes

© 2026 Bullseye Knowledge System Limited

The classroom kit

One kit per class section, used all year. Everything is printed, laminated and reusable.

Number-base pipe strips: decimal, binary, ternary (10 sets)

Dataset cards: deliveries and sports survey (2 decks)

AI audit picture cards: cats and dogs, bats and rackets (120)

Shape property and classifier cards (30)

Item	Quantity per kit
Number-base pipe strips	10 sets
Dataset cards (deliveries, sports survey)	2 decks of 40
AI audit picture cards	120
Shape property and classifier cards	30
Function, loop and decision card decks	4 decks of 54
Project data sheet pads (A4)	2 pads of 50
Project posters: AI lifecycle, rubric, fair AI	3
Teacher quick-guide card	1
Sturdy box	1

Illustrations show the design. Final materials will be confirmed after the pilot.

© 2026 Bullseye Knowledge System Limited

Assessment and the report card

CBSE asks for continuous, competency-based assessment in CT&AI. The teacher book includes an observation journal using four levels, and a term summary that fits on the report card.

Skill	Beginning	Developing	Secure	Extending
Algorithms	Follows given steps	Traces loops and conditions	Writes converters and classifiers	Designs, tests and improves algorithms
Number structure	Recalls facts	Uses rules with help	Uses bases, powers and identities	Explains why rules work
AI projects	Names the stages	Cleans data and measures accuracy	Runs the lifecycle and tests per group	Finds bias and fixes it with data
Projects	Takes part with help	Completes stages with help	Plans, tests and presents with the team	Improves the work using evidence

Sample term summary

Area	Level	Teacher comment
Computational thinking (overall)	Secure	Converts between bases confidently and writes clear if-else classifiers.
AI and ethics	Secure	Cleans data and measures accuracy; next step: explaining the limits of an audit.
Project 2: Fair AI Audit	Rubric 21 of 24	Found a 40-point gap between groups and cut it to 5 points by rebalancing the data.

Children check themselves too

Each chapter ends with **'How did I do?'**, where children colour a face for each 'I can' statement. Teachers can compare this with what they observed, which helps children learn to judge their own progress.

© 2026 Bullseye Knowledge System Limited

Answers for the sample chapters

3. A Story of Numbers

1. a) 1010
2. b) 4
3. 34 (27 + 0 + 6 + 1)
4. a) MCMXLVII
5. c) 6: 32 + 16 + 8 + 4 + 2 + 1
Build it: 100: rem 1, n = 33; rem 0, n = 11; rem 2, n = 3; rem 0, n = 1; rem 1, n = 0. Read backwards: 10201
Challenge: A switch has two states, on and off, so two digits are easy to store reliably. 2222 in base 3 = 54 + 18 + 6 + 2 = 80

AI 1. AI Project Lifecycle

1. a) define the problem
2. 75%
3. a) the car wash: it is automation
4. a) to check the model on data it has not seen
5. a) remove duplicates
Build it: 85%. Not yet: it should improve the data (for example more orders in bad weather) and retrain
Challenge: Open answer, for example: define 'real or fake headline'; collect checked real and fake headlines; clean and label them; train; test on new headlines; refine and only deploy with human checks

© 2026 Bullseye Knowledge System Limited

Cut-out code cards

Ask an adult to help you cut along the dotted lines. Use the cards to build programs on your desk, then act them out with a friend.

Define ___	give back ___	Repeat until ___
Define ___	give back ___	Repeat until ___
Repeat for each ___	If ___	else
Repeat for each ___	If ___	else
AND	OR	Input ___
AND	OR	Input ___
Set ___ to ___	change ___ by ___	say ___
Set ___ to ___	change ___ by ___	say ___

© 2026 Bullseye Knowledge System Limited

A note for parents

Schools can send this page home at the start of the year.

Dear parents,

This year your child will learn **computational thinking and AI**, following CBSE's new curriculum for Classes 3-8. In Class 8 that is about 100 hours over the year: problem solving linked to maths, four AI chapters and two group projects.

Your child will use the *Think Like a Coder* workbook. They will write numbers in different bases, sort shapes with rules, run an AI project from problem to model, check AI for fairness, and learn to protect their privacy online.

How you can help at home

- ✓ Ask your child to explain how an AI learns from data, using an app you both use.
- ✓ Look at the permissions on a family phone together. Does each app really need them?
- ✓ When a shocking video or message arrives, check it together with a trusted source before sharing.
- ✓ Praise careful thinking and honest results, even when a project does not go to plan.

Take-home challenge

Write your year of birth in binary and in base 3. Which needs more digits, and why?

Answer: answers vary; binary needs more digits because each place holds less.

No child's personal data is collected by the workbook. Thank you for your support.

Class teacher _____ **School** _____

© 2026 Bullseye Knowledge System Limited

Next steps for your school

1. **Look through this sample**
   Try a chapter with a class or ask a teacher to review it.

2. **Talk to us**
   A short meeting with the principal and coordinator to answer questions.

3. **Start a free pilot**
   Two or three sections, January to March 2027, with an orientation and weekly support.

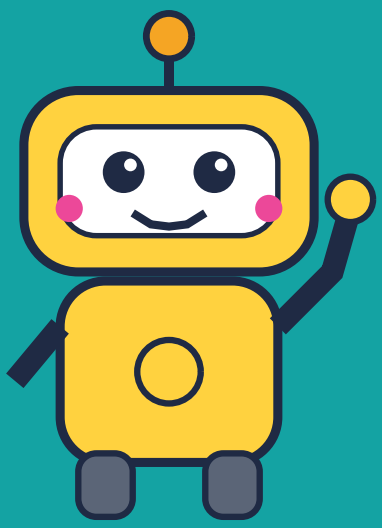

4. **Add it to the 2027-28 book list**
   Most schools finalise their list by the end of January.
