CODESCHOOL · PROPOSAL FOR [SCHOOL NAME] · DRAFT

Offline Programme

Computational Thinking, coding and AI for Classes 3-8, delivered with printed workbooks, unplugged kits and teacher scripts. No student devices needed.

Prepared by Anoop Dobhal, CodeSchool · [Phone] · [Email]

Draft version 0.1 · 6 November 2026

Aligned to CBSE's CT&AI curriculum for Classes 3-8 (2026-27)

A separate Online Programme proposal is available

Draft

This is a draft for discussion. Scope, timeline and prices are indicative and will be finalised with [School name] after the pilot discussion. Nothing in this document is a commitment until both sides sign an agreement.

1. Proposal at a glance

CodeSchool proposes a **free pilot** of its Offline Programme at [School name], followed, if the school is satisfied, by adoption for the 2027-28 session. The programme helps teachers deliver CBSE's new Computational Thinking and AI (CT&AI) curriculum for Classes 3-8 without needing a computer for every child.

Item	Proposal
What	Level-based CT, coding and AI lessons on paper and with unplugged activities, plus project kits, teacher scripts and an observation journal
Classes	3-8 (pilot in 2-3 sections, for example one Class 4 and one Class 7 section)
Pilot period	8-10 weeks, January to March 2027
Devices needed	None for students. A classroom projector is useful but optional
Who teaches	The school's own maths, EVS and computer teachers, using CodeSchool scripts
Cost of the pilot	Free: materials for pilot sections, teacher orientation and weekly support
After the pilot	Indicative Rs 449 (Classes 3-5) and Rs 599 (Classes 6-8) per student per year, on the school's published book list
Data collected	None about individual students. Only class-level pilot results, shared with the school's permission

2. Why this programme

From 2026-27, CBSE schools are asked to teach Computational Thinking and AI: **50 hours a year in Classes 3-5**, inside Mathematics and The World Around Us, and **100 hours a year in Classes 6-8** (40 hours of CT, 20 hours of AI and 40 hours of projects). CBSE's free student and teacher handbooks are a strong start. They provide maths puzzle banks that follow the NCERT maths chapters, plus a few unplugged activities.

Teachers still have to fill several gaps on their own:

- **No coding.** Students follow and compare algorithms, but never write one.
- **No project materials.** Classes 6-8 have 40 project hours a year with no briefs, rubrics or examples. CBSE has announced a project list with rubrics, but it has not yet been published.
- **Thin AI support for teachers.** The AI chapters in the teacher books contain answer keys, not lesson scripts. Hands-on AI appears only in Class 8 and needs computers, webcams and internet.
- **No assessment format.** CBSE asks for a Teacher Observation Journal but provides no template or report-card format.
- **Hard puzzles with no on-ramps.** The handbook puzzles are demanding, with no hints or easier steps for students who struggle.

The Offline Programme fills these gaps on paper, so it works in any classroom.

> **Our approach:** we do not replace CBSE's free books. We sit on top of them, chapter by chapter, and add what is missing: levels with hints, "now you build it" coding on paper, project kits with rubrics, AI teacher scripts and a ready-made observation journal.

3. Objectives

1. Help teachers deliver CBSE's CT&AI hours with confidence, using ready scripts that fit one period.
2. Move students from **following** algorithms to **building** them, starting in Class 3.
3. Give Classes 6-8 complete, assessable project kits for their 40 project hours.
4. Make AI understandable through hands-on, unplugged activities in every year from Class 6.
5. Give the coordinator a simple, competency-based record for report cards.

4. Scope

What is included

Component	Description	Classes
Level workbook	Short levels for each NCERT maths chapter, from warm-ups with hints to challenges	3-8
"Now you build it" coding	Paper code cards and cut-out blocks: students write instructions, and classmates "run" them	3-8
Unplugged activity kits	Printable games, cards and floor grids, with a teacher script for each	3-8
Project kits	Two 20-hour projects a year: brief, data sheets, worked examples and marking rubrics	6-8
AI activity cards	Unplugged classification, data and bias activities; projector demonstrations where available	6-8
Teacher scripts	Period-by-period plans with timings, answers and common mistakes	3-8
Observation journal	Printable competency checklist per class, with a term summary for report cards	3-8
Teacher orientation and support	In-person orientation, plus weekly phone or WhatsApp support during the pilot	All

What is not included

- Hardware, devices, internet or lab set-up.
- Replacing CBSE's handbooks or the NCERT maths textbook.
- Board-exam preparation for Classes 9-12.
- Any home tuition or parent-paid add-on during the pilot.

5. Programme design

Levels that follow the maths chapters

Every lesson is tied to the NCERT maths chapter the class is studying, so teachers find "today's" material in one place. Within each chapter, students move through short levels: a warm-up, a guided level, a build level and a challenge. A student who finishes early moves ahead; a student who struggles gets a hint card. The teacher keeps the class together.

One routine for every lesson (about 40 minutes)

Step	What happens	Minutes
1. Predict and run	Students predict what a short set of instructions will do, then act it out	8
2. Investigate	Pairs answer tracing questions about why it worked	8
3. Modify	Students change the instructions to do something new	8
4. Parsons puzzle	Students put jumbled instruction cards in the right order	8
5. Make	Pairs create their own rule or program and swap with another pair	6-8

This structure is based on research on teaching programming (the PRIMM approach with Parsons problems), and it works without a computer. A complete sample lesson for Class 4 ("Robo makes choices") is available on request.

Class-by-class outline

Class	Computational thinking and coding	AI	Projects
3	Sequences, repeat loops and events on floor grids; secret codes (ciphers); path puzzles from the maths chapters	Sorting objects by features (enrichment)	Short class challenges
4	If-then-else choices ("Robo makes choices"); nested loops; error-finding with parity cards	Spotting patterns in pictures (enrichment)	Short class challenges
5	Variables and inputs on paper; searching and sorting strategies; a capstone game designed on paper	How examples teach a machine (enrichment)	Short class challenges
6	Custom steps (functions); lists and data from the Data Handling chapter	What AI is; classifying with picture cards; data and patterns	Two 20-hour projects (for example, weather data across states)
7	Data tables and charts; prediction from patterns	Classification, clustering and bias with card labs	Two 20-hour projects (for example, a weekly food planner)
8	Reading simple Python on paper; tracing and debugging	The AI project cycle; a teacher-led classifier demonstration on one projector	Two 20-hour projects (for example, sports participation data)

Project examples follow the topics CBSE presented in its April 2026 webinar, and will be aligned to CBSE's official project list when it is published.

6. How it runs offline

Element	Classes 3-5	Classes 6-8
Time	Within CBSE's 50 hours a year, about 1-2 maths or TWAU periods a week	Within CBSE's 100 hours a year, about 3-4 periods a week across CT, AI and projects
Who teaches	Maths or EVS teacher	Subject teachers for CT; computer teacher for AI and projects, as CBSE suggests
Materials	Workbook, printable kits, cut-out blocks, floor grid (chalk or tape)	Workbook, project kits, AI activity cards
Room	Normal classroom	Normal classroom; projector optional for demonstrations
Preparation	About 5-10 minutes per lesson, using the script	About 10 minutes per lesson; projects have a week-by-week plan

7. Implementation plan and timeline

Phase	When	What happens	Output
1. Agree scope	December 2026	Meet principal and coordinator; choose pilot sections and teachers; return the response form	Signed pilot letter
2. Prepare	Early January 2027	Deliver pilot materials; 2-hour teacher orientation at school; agree the weekly timetable	Teachers ready; timetable fixed
3. Pilot	January to March 2027 (8-10 weeks)	Teachers run lessons; CodeSchool checks in weekly; the coordinator keeps the journal	Lessons delivered; journal entries
4. Review	Mid-March 2027	Compare results with the agreed success measures; collect teacher and student feedback	Short pilot report for the school
5. Decide and roll out	April 2027 (2027-28 session)	If the school continues: book-list entry, orientation for all teachers, materials for all sections	Programme running in all chosen classes

Book-list timing: most schools finalise next year's book list in December-January, before the pilot ends. Schools that want the programme from April 2027 can review specimen copies and a sample lesson in December and decide then; the pilot will still shape how the programme is taught.

8. Teacher support and training

- **Orientation (2 hours, at school):** the lesson routine, a live demonstration lesson, and how to use the journal.
- **Scripts in every lesson:** timings, what to say, answers and the mistakes students usually make.
- **Weekly check-in during the pilot:** 15 minutes by phone or WhatsApp, plus a shared question channel.
- **Short how-to videos:** optional, for teachers who want to see an activity before running it.
- **No specialist needed:** the programme is designed so that a maths or EVS teacher can run it.

9. Assessment and reporting

- **Level checks:** a short check at the end of each chapter's levels, marked with an answer key in minutes.
- **Observation journal:** a one-page checklist per class mapped to CBSE's CT&AI competencies (abstraction, pattern recognition, decomposition and algorithmic thinking, plus AI literacy for Classes 6-8).
- **Project rubrics:** clear criteria and score bands for every project, for teacher and peer assessment.
- **Term summary:** a simple grade per competency, ready for the report card.
- **Optional baseline:** a 15-minute puzzle check at the start and end of the pilot to show progress.

10. What we need from the school

Need	Detail
A pilot lead	The coordinator or a senior teacher as our single point of contact
Teachers	One named teacher per pilot section, available for the 2-hour orientation
Timetable	The agreed periods per week for the pilot sections
Feedback	Two short feedback conversations (mid-pilot and end)
Printing (optional)	Access to a printer for extra copies of activity sheets, if needed

11. Child safety and data protection

- **No student accounts and no student data.** The offline programme works entirely on paper.
- **No photos or recordings of students** are taken by CodeSchool.
- **Pilot results are shared only as class-level summaries** (for example, the share of students who passed a level check), with the school's permission.
- Student names stay in the school's own records and journal. If any data is ever needed, it will be handled under India's Digital Personal Data Protection Act, 2023, with the school in control.

12. Pilot success measures

These are agreed in advance so the pilot result is clear to both sides. Targets are suggestions and can be changed.

Area	Measure	Suggested target
Teacher delivery	Planned pilot periods the teacher ran without outside help	80%
Fit	Lessons that fit within one period	90%
Learning	Students passing the level check after each chapter	70%
Engagement	Students completing the "make" step	75%
Teacher time	Preparation time per lesson	10 minutes or less
Teacher view	Would use it again next session (1-5)	4 or more
Reporting	Journal usable for report cards	Yes

13. Investment

The pilot

The pilot is **free**. CodeSchool provides materials for the pilot sections, the orientation and weekly support. There is no obligation to buy afterwards.

After the pilot (indicative)

Package	Includes	Indicative price
Classes 3-5 Practice Pack	Level workbook, printable kits, coding cut-outs, observation journal	Rs 449 per student per year (MRP)
Classes 6-8 Projects and AI Pack	Level workbook, two project kits with rubrics, AI activity cards, observation journal	Rs 599 per student per year (MRP)
Teacher materials	Scripts, orientation, and support for all teachers using the packs	Included

- The packs can **replace the existing Computers book** on the book list, so the total cost to parents stays about the same.
- The packs are listed on the school's published book list and are also available from booksellers and online, so **no parent is required to buy from one source**.
- **No new fee head** is needed.
- Prices are indicative and will be confirmed after the pilot. Taxes, if any, will follow the final package structure.

14. Roles and responsibilities

Task	CodeSchool	School
Lesson materials, kits and scripts	Provides	Reviews
Teacher orientation and weekly support	Leads	Releases teachers to attend
Timetabling pilot periods	Advises	Decides
Teaching the lessons	Supports	Delivers
Observation journal	Provides format	Keeps records
Pilot review and report	Prepares	Reviews and decides

15. Risks and how we manage them

Risk	How we manage it
Teachers have little time to prepare	Every lesson has a 5-10 minute script; orientation covers the routine once
Lessons run over a period	Every lesson is designed for 40 minutes, with an optional extension
Puzzles too hard for some students	Hint cards and warm-up levels in every chapter
CBSE publishes its own project list or rubrics	Project kits will be aligned to CBSE's topics when they are published
Pilot classes miss periods for events or exams	The plan allows 8-10 weeks and can pause and resume

16. Offline or online: choosing the right fit

Question	Offline Programme	Online Programme
Student devices needed?	No	Yes, shared devices (about 1 per 2 students during the lesson)
Where students practise	Paper workbook and classroom activities	App or browser, with automatic checking
Coding	On paper, with cut-out blocks	Block coding on screen
AI	Unplugged card labs; projector demonstration	Hands-on model training in the browser with supplied datasets
Teacher reporting	Printable journal	Live class dashboard and report-card export
Student data	None	School-managed accounts using roll numbers

Many schools may prefer a **hybrid**: the Offline Programme in Classes 3-5 and the Online Programme in Classes 6-8, where the computer lab is available. See the separate Online Programme proposal.

17. Next steps

1. A short meeting with the principal and coordinator to agree the pilot sections.
2. The school returns the response form below.
3. CodeSchool shares specimen materials and a sample lesson in December 2026.
4. Teacher orientation and the pilot start in January 2027.

School response form

Fill this in on screen or on paper and return it to CodeSchool. It is an expression of interest, not a contract.
